Data finns och skapas ständigt runt oss

Big Data (three V's)

- Volume
- Velocity
- Variety

# Who is Cristofer?

Research manager, Göteborg

**RI  
SE**

Associate Professor, Halmstad University

Research interest: AI, Machine Learning, cooperative and automated vehicles, behavior modelling, traffic systems

## Volume

Volume is how much data we have – what used to be measured in Gigabytes is now measured in Zettabytes (ZB) or even Yottabytes (YB). The IoT (Internet of Things) is creating exponential growth in data.

The background of the slide is a perspective view of a server aisle. The aisle is formed by two rows of server racks that recede into the distance. The entire scene is rendered in shades of blue and cyan, with a glowing, ethereal light emanating from the center of the aisle. Overlaid on this background are numerous vertical columns of code snippets, including C++ preprocessor directives like #include, #define, and #ifdef, as well as various C++ keywords and symbols such as std::, cout, endl, and namespace. The code is presented in a monospaced font, typical of a code editor or terminal window.

## Velocity

Velocity is the speed in which data is accessible. I remember the days of nightly batches, now if it's not real-time it's usually not fast enough.

Variety describes one of the biggest challenges of big data. It can be unstructured and it can include so many different types of data from XML to video to SMS. Organizing the data in a meaningful way is no simple task, especially when the data itself changes rapidly.

**CHALLENGES  
AHEAD**

*"Data is cheap but it's dumb"*

*"Information is the oil of the 21st century, and analytics is the combustion engine"*

*"Big data is not about the data"*

Peter Sondergaard, Senior  
Vice President, Gartner

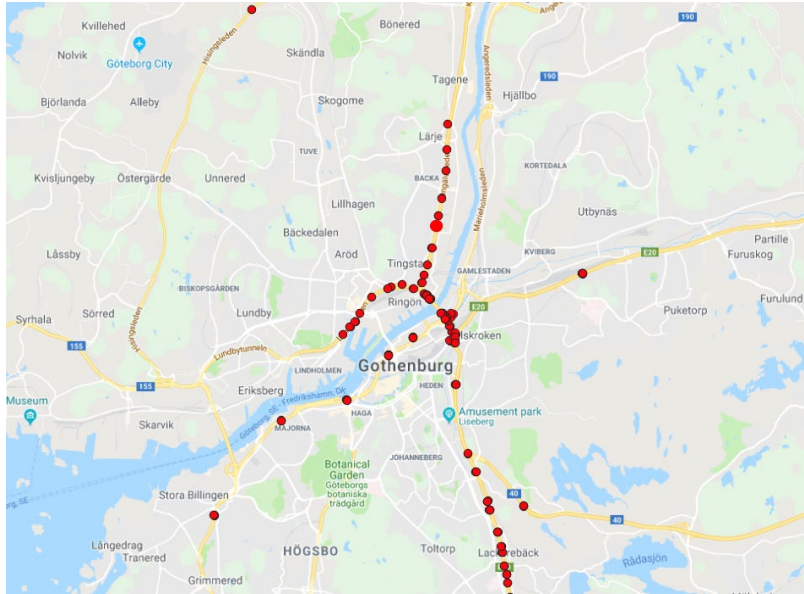

**Volume:** Massive volume of data from sensors (vehicle, infra) such as CAN bus data, camera/lidar/radar, speed sensors, GPS trajectories,...

**Velocity:** Graph search, or Neural networks-based modelling tools to derive inference model(s) that use realtime data capable of finding abnormal traffic patterns in real-time.

**Variety:** From visual and other types of sensor data, spatial information (GPS trajectories), time-series to traditional structured data + metadata + text

# What we did

- Data driven traffic management policy

Fixed infrastructure sensors

Traffic related events

# What we did

- Data driven traffic management policy

## Analysis

## Prediction

# What we did

## – Freefloating car service analysis

Google

Weatherstations

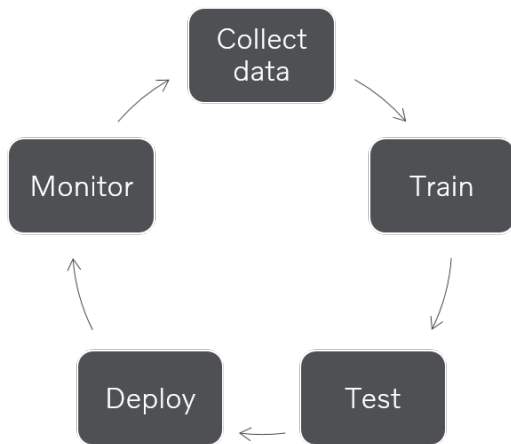

RI SE

# What we did

## – Freefloating car service analysis

- Data collection
- Data alignment
- Data cleaning
- Data pre-processing
- Data visualization
- Data clustering

Google

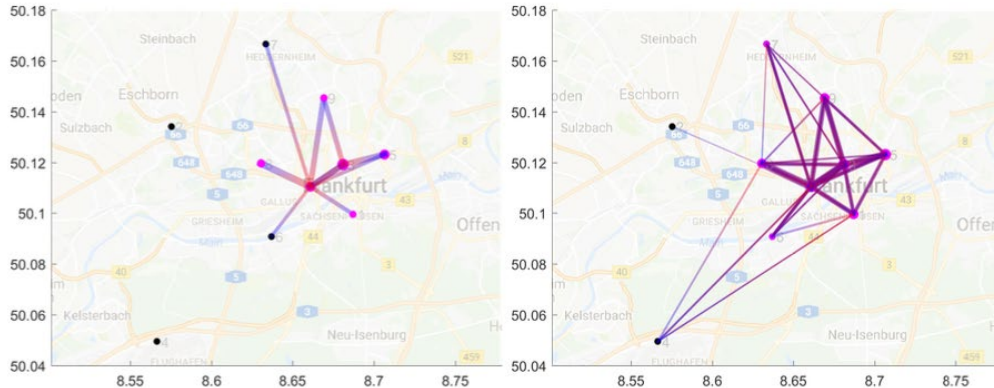

Weatherstations

RISE

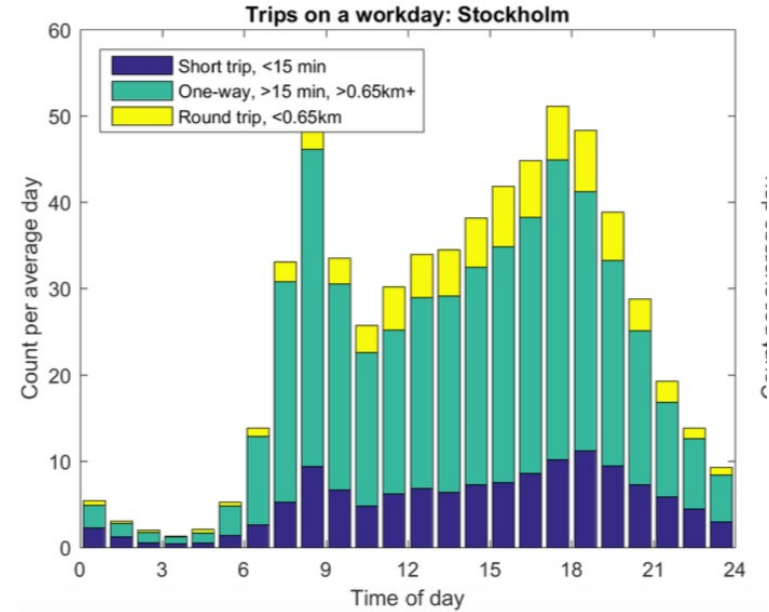

# Free floating car sharing behaviour analysis

- Business analytics
  - How is the service used?
  - How can the service be improved?
  - Between where is the service used?
  - Should the operator re-distribute vehicles?

(a) Frankfurt-Morning

(b) Frankfurt-Evening

To organize, visualize, clear, model and draw conclusion  
you often need data analytics skills on the PhD level

Education!  
Tools!

# Wrap-up

Volume  
Velocity  
Variety

Strategic and operational planning  
Business operation
